

### Assignment 3

tldr: Classify MNIST digits with a (optionally convolitional) neural network. Get at least 95.5% accuracy on the test test.

**Problem Statement** Consider the MNIST dataset consisting of 50,000 training images, and 10,000 test images. Each instance is a  $28 \times 28$  pixel handwritten digit zero through nine. Train a (optionally convolutional) neural network for classification using the training set that achieves at least 95.5% accuracy on the test set. Do not explicitly tune hyperparameters based on the test set performance, use a validation set taken from the training set as discussed in class. Use dropout and an  $L^2$  penalty for regularization. Note: if you write a sufficiently general program the next assignment will be very easy.

Do not use the built in MNIST data class from TensorFlow.

**Extra challenge (optional)** In addition to the above, the student with the fewest number of parameters for a network that gets at least 80% accuracy on the test set will receive a prize. There will be an extra prize if any one can achieve 80% on the test set with a single digit number of parameters. For this extra challenge you can make your network have any crazy kind of topology you'd like, it just needs to be optimized by a gradient based algorithm.
